"Hemipterous encodes a novel Drosophila MAP kinase kinase, required
for epithelial cell sheet movement.";
Cell 8:451-461(1995).

-- FUNCTION: REQUIRED FOR THE EPITHELIAL CELL SHEET MOVEMENT CALLED
DOSGAL CLOSURE (DC), WHICH ALLOWS ESTABLISHMENT OF THE DORSAL
EPIDERMIS. CONTROLS THE EXPRESSION IN THE DORSAL EPITHELIUM EDGES
OF ANOTHER DORSAL CLOSURE GENE, PUCKREED (PUC).

-- PTM: MAPKK IS ITSELF DEPENDENT ON SER/THR PHOSPHORYLATION FOR
ACTIVITY CATALIXED BY MAP KINASE KINASE KINASES (BY SIMILARITY).

-- PTM: WEAKLY AUTOPHOSPHORYLATED.

-- SIMILARITY: Belongs to the Ser/Thr family of protein kinases. MAP
kinase kinase subfamily.
                                                                                                                                                                                                                                                                                                                                                                15 VPCWLPWRTWWWSSSSTAWVSWASSALETSTOPATGATWTKWLHYAGSSRISPTL---EA

New peptides and its encoding nucleic acid derived from intestinal carboxyesterase, useful as immunostimulants for treating cancer.

Claim 2; Page 33; 53pp; French.

The present sequence is derived from a human intestinal carboxylesterase (iCE) polypeptide. iCE induces specific-specific cytotoxic T lymphocytes (CTL) and secretion by these CTL of cytotoxic factors, e.g. interleuking, interferon gamma and tumour necrosis factor. iCE polypeptides and polynucleotides are used for treating cancer, by in vivo or in vitro immunisation, particularly solid cancers and most especially hepatocarcinoma or adenocarcinoma of colon and kidney. They are also used to stimulate the immune system, and to increase, in culture, the production of associated cTL, for reinjection, and/or to induce secretion of cytotoxic factors from CTL. Dendritic cells loaded with iCE are used to induce such CTL in cultures

Sequence 9 AA;

```
The invention relates to a composition (I) comprising an immune effector cell and a cell penetrating peptide (CPP) associated with an antigen or antibody. Also included are (I) a vaccine comprising (I), CPP associated with an antigen, and a pharmaceutically acceptable carrier and (2) preparing a composition for a disease, by providing (I) and CPP associated with an antigen for disease, by providing (I) and CPP corrected with an antigen for disease, and introducing the antigens are, for example, tumour antigen derived epitopes recognised by tumour infiltrating lymphocytes (TIL) of HLA (human leukocyte antigen) class I corrected to associated with an antigen dendritic cell comprising CPP associated with an antigen to disease, to the animal, such that following comprises both CD4+ and CD8+ T cells. It is also useful for treating a disease (e.g. cancer, unon-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, uterine cancer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, uterine cancer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, and cancer, and antigen to an antigen to a seasociated and instance, and comprises both CD4+ and CD8+ T cells. It is also useful for treating cancer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, uterine cancer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, uterine cancer, non-Hodgkin's lymphoma, and an and an antigen to a
                                                                     ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                breast cancer, prostate cancer, ovarian cancer and pancreatic cancer). The animal is further subjected to a cancer treatment including surgery, radiation, chemotherapy or gene therapy. The administration of (I), preferably dendritic cell is prior to, subsequent to or concurrent with the cancer treatment. The present sequence is a tumour antigen derived epitope for inclusion in the composition of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is derived from a human intestinal carboxylesterase (CIL) and secretion by these CIL of cytotoxic factors, e.g. interleuking, interference and secretion by these CIL of cytotoxic factors. e.g. interleuking, interference and make and tummour necrosis factor. iCE polypeptides and immunisation, particularly solid cancers and most especially hepatocarcinoma or adenocarcinoma of colon and kidney. They are also used to stimulate the immune system, and to increase, in culture, the production of associated-associated CIL, for reinjection, and/or to induce secretion of cytotoxic factors from CIL. Dendritic cells loaded with iCE are used to induce such CIL in cultures
                                                                                                                                                                                                                                                                                                                                                Intestinal carboxylesterase; iCE; tumour; cytotoxic T lymphocyte; CTL; cytotoxic factor; interleukin-2; interferon gamma; adenocarcinoma; tumour necrosis factor; cancer; hepatocarcinoma; colon; kidney.

The invention relates to novel peptides that can antagonise the interaction of insulin-like growth hormone 1 (IGF-1). The peptides are useful for treating disorders such as cancer, diabetic complication exacerbated by IGF-1, e.g. diabetic retinopathy or nephropathy, acromegaly, age-related macular degeneration, ischemic injury or trauma. Other disorders that can be treated by the peptide include restenosis or asthma. This sequence represents a peptide relating to the IGF antagonist peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cardiovascular system antigen; human; mouse; rabbit; goat; horse; cat; cloken; sheep; immunosupressive; antiarthritic; vasotropic; dog; antirheumatic; antiproliferative; cycotatic; cardiant; neuroprotective; cerebroprotective; nootropic; antibacterial; virucide; fungicide; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is encoded by the coding region of human intestinal carboxylesterase (ICE) gene. ICE induces specific-specific cytotoxic T lymphocytes (CTL) and secretion by these CTL of cytotoxic factors, e.g. interleukin-2, interferon gamma and tumour necrosis factor. ICE polypeptides and polynucleotides are used for treating cancer, by in vivo or in vitro immunisation, particularly solid cancers and most especially hepatocarcinoma or adenocarcinoma of colon and kidney. They are also used to stimulate the immune system, and to increase, in culture, the production of associated associated CTL, for reinjection, and/or to induce secretion of cytotoxic factors from CTL. Dendritic cells loaded with iCE are used to induce such CTL in cultures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; antidiabetic; osteopathic; vasotropic; tranquiliser; IGF-1; vulnerary; antisathmatic; ophthalmological; antagonise; ischemic injury; insulin-like growth hormone 1; IGF; cancer; diabetic; nephropathy; diabetic; nephropathy; acromegaly; macular degeneration; trauma; asthma;

New cardiovascular system related polynucleotides and polypeptides, useful for diagnosing, treating and/or preventing disorders of the cardiovascular system.

'n

```
polypeptides of the invention. Cardiovascular system antigens and their associated polymucleotides are useful in the diagnosis, treatment and prevention of various types of disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by detecting the presence or absence of a mutation in a cardiovascular system antigen polymucleotide. The treatable disorders include autoimmune diseases such as rheumatoid arthritis, hyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cardiac arrest, occular disorders such as corneal infection, endocrine disorders such as asthma and pleuristy. The polypeptides can also be used to aid wound healing, to prevent skin aging due to sunburn, committain organs before transplantation, to regenerate tissues and in chemicaxis. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WiPo at ftp.wipo.int/pub/published_pot_sequences

New cardiovascular system related polynucleotides and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer of cardiovascular tissues and cancer metastases.

Claim 11; SEQ ID NO 648; 262pp; English.

The invention relates to human cardiovascular system related polypeptides and the polymucleotides encoding them. The polypeptides, polymucleotides and antibodies to the polypeptides are useful for diagnosing a pathological condition or a usceptibility to a pathological condition, for preventing, treating, or ameliorating a medical condition, such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This represents the amino acid sequence of the B29-1 protein. This protein can bind to the Vpr protein encoded by the HIV genome. The invention provides a method of identifying an agent for use in treating lentiviral infections. The method comprises contacting a cellular target of the Vpr protein with the agent to be tested, and assessing the ability of the Vpr protein with the agent to be tested, and assessing the ability target, where an agent which blocks this interaction is an antilentiviral agent. Alternatively, the agent contacts a cell expressing the two protein under conflictions where the Vpr protein induces cell stassis in the absence of the agent. Identification of the agent is then observed by blockage of Vpr-induced cell stasis. The method allows the identification
              and developmental abnormalities, haematopoietic disorders, diseases of arthetimus system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, kidney disorders, gastrointestinal disorders, pregnancy-related disorders, endocrine disorders and infections. The nucleic acids are also useful for chromosome identification, radiation hybrid mapping or long-range restriction mapping. The polypeptides and polymucleotides may also be used as food additives or preservatives to increase or components. This sequence represents a human cardiovascular system related polypeptide of the invention.
  of cardiovascular system tissues, proliferative disorders, foetal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identification of compounds binding the HIV-1 Vpr protein - that block Vpr-mediated cell stasis, useful for treating HIV-1 or other lentiviral infections.
                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                       ;

This protein can bind to the Vpr protein encoded by the HIV genome. This is used as a cellular target in the method of the invention of identifying antitumour therapeutic candidates. The invention provides a method for arresting the growth of a cell by treatment with a Vpr lentivirus protein or its amalogue. Agents that reduce binding of Vpr to a cellular target are useful for treating HIV (human immune deficiency virus) infection or useful for restoring growth. The antitumour agent identified is useful for treating any type of cancer, since it induces cell stasis (blocks development at the G2 stage) and death. The agents can also be used for treating autoimmune diseases. (Updated on 25-MAR-2003 to correct

The invention discloses a polymucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel colypeptides. Also claimed is a polypeptide encoded by the polymucleotide or peptide or peptide or peptide or peptide of the polymucleotide, immunologically assaying the polypeptide or peptide or peptide of the polymucleotide by contacting the polypeptide or peptide or with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymucleotide in an expressible manner and an antisense polymucleotide. The oligomucleotide contacting the polymucleotide in an expressible manner and an antisense polymucleotide. The oligomucleotide of su seeful as a primer for synthesising the polymucleotide in as a probe for of electing the polymucleotide. The polymucleotides and encoded of proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and many disease-related of genes may be included in their for developing a diagnostic marker or mediciones for regulation of their expression and activity, or as targets of genes may be included in their aspression and activity, or as targets of genes may membrane proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate concount the manner of the antitude of protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed provened by the provened protein of the invention supplied by the

The invention relates to novel foetal polypeptides encoded by polynucleotides comprising one of 477 sequences fully defined in the specification. The foetal polynucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune the treatment and diagnosis of osteoporosis), thrombolytic disorders, nervous system disorders and inflammation. The present sequence is a polypeptide encoded by a cDNA assembled using an expressed sequence tag
                                                                                                                                                                                  nootropic; neuroprotective; thrombolytic; osteopathic; antiinflammatory; gene therapy; antisense therapy; cancer; immune disorder; growth disorder; osteoporosis; thrombolytic disorder; networks system disorder; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel fetal proteins useful for the treatment and diagnosis of diseases associated with dysfunction of the protein e.g. cancers, immune disorders, growth disorders, thrombolytic disorders, nervous system disorders and inflammation.
                                                                                                                                                                  Human; foetal protein; cytostatic; immunosuppressive; immunostimulant;

                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel foetal polypeptides encoded by polymuclectides comprising one of 477 sequences fully defined in the specification. The foetal polymucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. ostooporosis), thrombolytic disorders, polypeptide encoded by a cDNA assembled using an expressed sequence is a polypeptide encoded by a cDNA assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue cDNA libraries
                                                                                                                                                                                                                                                                                                                                                                          nootropic; neuroprotective; thrombolytic; osteopathic; antiinflammatory; gene therapy; antisense therapy; cancer; immune disorder; growth disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel fetal proteins useful for the treatment and diagnosis of diseases associated with dysfunction of the protein e.g. cancers, immune disorders, growth disorders, thrombolytic disorders, nervous system
                                                                                                                                                                                                                                                                                                                                                          foetal protein; cytostatic; immunosuppressive; immunostimulant;

This invention describes a novel nucleic acid encoding a Hepatitis C Virus (HCV) truncation mutant of NSSB. The product of the invention has immunoprotective activity and can be used as a vaccine. the NSSB mutant or a nucleic acid vector directing expression of the mutant, are used to induce an immunological response in a mammal. Antibodies against the NSSB mutant are used to protect mammals against diseases caused by viruses of the Flaviviridae. Additionally, soluble protein produced by the method would allow for determination of the structure of the protein wax-ray crystallography or other known methods. The HCV NSSB truncation mutant has a deletion of a hydrophobic tail which release the protein into the soluble portion of the call, allowing for a greater recovery of soluble protein for screening for inhibitoris of NSSB enzymatic activity. AAVI25293-Y25322 represent the carboxy-terminus of the NSSB protein from various HCV genotypes which are used to desribe the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; primer; detection; diagnosis; antisense therapy; gene therapy.

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

Claim 8; SEQ ID NO 18691; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full
[a] an Oilgo-dry primer and an Oilgonucleotide complementary to the

[c] an oilgo-dry primer and an oligonucleotide comprises one of the 5602

[c] complementary strand of a polynucleotide which comprises one of the 5602

[c] complementary strand of a polynucleotide which comprises one of the 5602

[c] controlleotide comprises at least 15 nucleotides; or (b) a combination

[c] c] complementary strand of a polynucleotide which comprises a 5'-end

[c] complementary strand of a polynucleotide which comprises a 5'-end

[c] sequence and an oligonucleotide comprises a 3'-end sequence complementary to a

[c] complementary strand of a polynucleotide which comprises a 1'-end sequence, where the

[c] complementary strand of a polynucleotide such sequence complementary to a

[c] complementary strand of a polynucleotide such the complementary to a

[c] complementary strand of a polynucleotides and the complementary to a

[c] complementary strand of sequence is selected from those defined in the

[c] c] complementary the primer are useful for synthesising polynucleotides,

[c] particularly full-length cDNAs. The primers are also useful for the

[c] c] contains and complementary and containing of the proteins encoded by

[c] c] contains and contained contain

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

is Sequence 18536, Application US/09252991A

is Patent No. 6551795

is CENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

ITILE OF INVENTION: NUCLEIC ACID ANNO ACID SEQUENCES RELATING TO PSEUDOMONAS

ITILE OF INVENTION: NUMBER: US/09/252,991A

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR PILING DATE: 1998-02-18

PRIOR PELING DATE: 1998-02-18

PRIOR PELING DATE: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 18536

TENNOWER: US 9836

TENNOWER: US 9836
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 6

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPBUTICS

FILE REFERENCE: 107196.136

CURRENT PELICATION NUMBER: US 60/094,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-02-18

PRIOR PAPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 3, Application US/09014416

US-09-252-991A-19066
; Sequence 19066, Application US/09252991A
; Sequence 19066, Application US/09252991A
; Patent No. 6521795
; GENERAL INFORMATION:
; APPLICANTON: WUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
; TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
; TITLE OF INVENTION: WURBER: US/09/252,991A
; CURRENT APPLICATION NUMBER: US/09/252,991A
; CURRENT FILING DATE: 1998-02-18
; PRIOR PILING DATE: 1998-02-18
; PRIOR PILING DATE: 1998-02-18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Patent No. 6551795

Batent No. 6551795

GENERAL INFORMATION:
APPLICANT: MARC J. Rubenfield et al.
APPLICANT: MARC J. Rubenfield et al.
TITLE OF INVENTION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS:
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR SEQIENCE: 1998-07-27
NUMBER OF SEQIENCE: 1998-07-27
SEQIENCE: 1998-07-27
LENGTH: 360
LENGTH: 360

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUBUNIT: F-type ArPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(3), beta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a, b and c. SUBCELLULAR LOCATION: Integral membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                          Genes Dev. 12:3703-3714(1998).
-!- FUNCTION: Probable transcription factor that may be involved in the ethylene response pathway.
-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
-!- SIMILARITY: Belongs to the EIN3 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Transcription regulation; Nuclear protein; DNA-binding; Coiled coil. -! CATALYTIC ACTIVITY: Hydrolysis of the 1,4-beta-linkages between Nacetyl-D-glucosamine and N-acetylmuramic acid in peptidoglycan acetyl-D-glucosamine and N-acetylmuramic acid in peptidoglycan heteropolymers of the prokaryotes cell walls.
-! SUBCELLULAR LOCATION: Extracellular.
-! SIMILANITY: Belongs to family 25 of glycosyl hydrolases.
